

Update Item Names - Plugin

In 400 Inventory we have a plugin for updating item names.

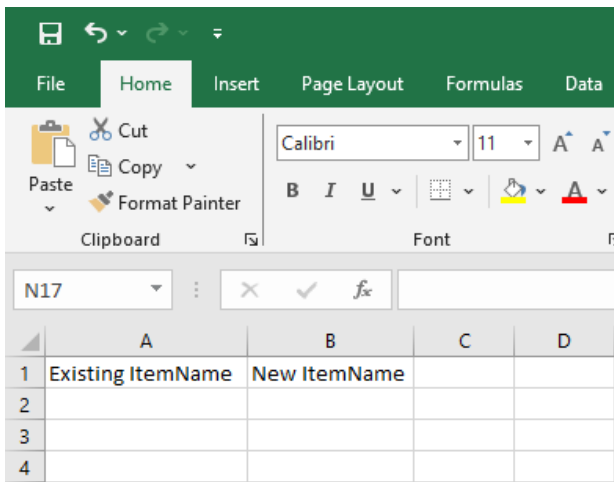

When you run it, you will need to select a valid import file using the button at the top of the screen.

The file can be in either .xlsx, .xls, or .csv format.

It must have columns headed **Existing ItemName** and **New ItemName**, with the relevant values in each column.

NB * The spelling of the column headings is important.

When you are ready, click the Run button, and it will attempt to identify each item that appears in the Existing ItemName column, and replace it with the corresponding value from the New ItemName column.

You will see a list of anything that can't be matched when it finishes.
